

# burn...baby burn

## digital secure roi copies

### No EMR needed

- Substantially reduces departmental costs
- Intelligent search for HL7 documents
- Scan / import paper documents too
- Disc created is searchable
- Integrates with Rimage Disc Publishing Systems
- Disc encryption security available
- HL7 and HIPAA compliant

HIMs professionals must handle a growing number of requests for legal and secure copies of patient data. Today this process is often manual and requires printing out massive amounts of paper. Workflow is inefficient and copies are not secure.

### What is DISCO?

DISCO (Digital Secure Copy) is a **medical records department's new best friend!** DISCO is a cost-effective, easy to use, turnkey solution to search, compile and copy, full or partial, patient charts to portable, secure and thermally printed discs for distribution. DISCO integrates with any practice management system (PMS), electronic medical records system (EMR) or electronic health records system (EHR) that complies with HIPAA and HL7 standards.

### Current State of ROI Fulfillment

"Release of Information" or ROI requests that medical records departments receive, can be extraordinarily expensive to process due to the manpower required for fulfillment. Many times, facilities are partially converted to EMR, making chart copy fulfillment even more cumbersome. Even facilities with the most advanced EMR system, are still making physical chart copies from within the EMR. **The future of ROI fulfillment is DISCO.**

powered by rimage disc publishing systems

**DISCO can be integrated into any work environment, whether it is entirely paper-based, EMR-based, or a hybrid of both, to provide a digital disc, CD or DVD, in lieu of photocopying mounds of paper patient charts.**

### Already have an EMR?

If the EMR system is HL7 based, DISCO easily integrates to query, retrieve and burn a chart folder to disc. It searches for additional HL7 data, TIFs, JPGs, PDFs, etc., and can also include other data the EMR doesn't already collect, to burn to disc.

### No EMR? No problem.

Based on an HL7 query, DISCO searches the data within the HIS. Once collected, the data is organized and a CD is ready to be burned. If your office is entirely paper-based, DISCO can help you eliminate ROI copy expenses today, while simultaneously creating digital files to import to an EMR, for the future. All patient files physically remain on site, managed by your staff, scanned and imported into DISCO's secure online archive.

### About the bundled solution

The DISCO bundle is comprised of the Rimage disc publishing system and application software. The Rimage disc publishing system is available in many configurations with multiple burners. Rimage Disc Publishing Systems are prolific in radiology departments, worldwide, for image management, shelf archive and image distribution in a referral environment.
